# Precious Seconds for Preemies

Allowing a mother and her baby to stay physically attached for just a bit longer after birth could save the newborn's life, according to new research from Baylor University Medical Center's neonatal intensive care unit (NICU).

A large-scale study by Baylor Research Institute looked at 148 preterm infants (less than 32 weeks' gestation), comparing those who were immediately removed from the placenta and had the cord cut with those who had a 45-second delay.

Waiting 45 seconds to clamp the umbilical cord reduces a premature infant's risk of bleeding in the brain by almost 50 percent, the study found. These results, to be published in the *American Journal of Obstetrics & Gynecology*, confirmed the findings of previous smaller studies.

Historically, concerns about waiting to resuscitate preemies with breathing problems have led to inconsistent policies nationwide regarding the timing of cord

cutting. But because of the large size of Baylor Research Institute's study, the results could give delayed cord clamping the evidence-based support it needs for wider acceptance.

Although some infants born with breathing problems need immediate cord cutting and resuscitation, significantly fewer babies in the study who got delayed cord clamping were intubated in the delivery room.

## WE'RE READY IF YOU NEED US

## #1 Hospital in Dallas-Fort Worth

We're pleased to announce that Baylor University Medical Center at Dallas has been ranked No. 1 in the Dallas-Fort Worth area and No. 3 in Texas for 2015–16 by *U.S. News & World Report*.

*U.S. News* ranks the nation's top 50 hospitals in various specialties and recognizes other high-performing hospitals that provide care at nearly the level of their nationally ranked peers.

These Baylor Dallas medical specialties were nationally ranked among the top 50:

- ▶ Diabetes and endocrinology (No. 41)
- ▶ Gastroenterology and gastrointestinal surgery (No. 26)
- ▶ Neurology and neurosurgery (No. 43)

These specialties were ranked as high-performing:

- ▶ Cancer
- ▶ Ear, nose and throat
- ▶ Geriatrics
- ▶ Gynecology
- ▶ Nephrology
- ▶ Orthopedics
- ▶ Pulmonology
- ▶ Urology

*U.S. News* recognizes facilities that excel in treating the most challenging cases. Rankings are based on objective measures such as patient survival and safety data, and the adequacy of nurse staffing levels.

# 5,535

That's the number of kidney transplants made possible by living donors in the U.S. last year. **To be considered as a donor for a living kidney transplant**, you need to be age 18 to 65, healthy and a blood-type match with the recipient.

## Your Body Wants You to Stop Smoking

Of course you know that smoking is bad for your lungs, but the damage doesn't end there. In fact, hardly an inch of the body escapes unharmed. We take a top-down look at the ill effects.

### MORE

#### It's Quittin' Time

To find the tools and resources you need to quit smoking for good, visit [BaylorHealth.com/QuitSmoking](http://BaylorHealth.com/QuitSmoking) today.

#### EYES

Your chances of getting cataracts increase.

#### TEETH

Poor dental health, even tooth loss, is a common consequence.

#### HEART

Your risk of heart disease is two to four times greater than that of a nonsmoker.

#### LUNGS

It's not just lung cancer. Smoking can also cause emphysema and chronic bronchitis.

#### MIDSECTION

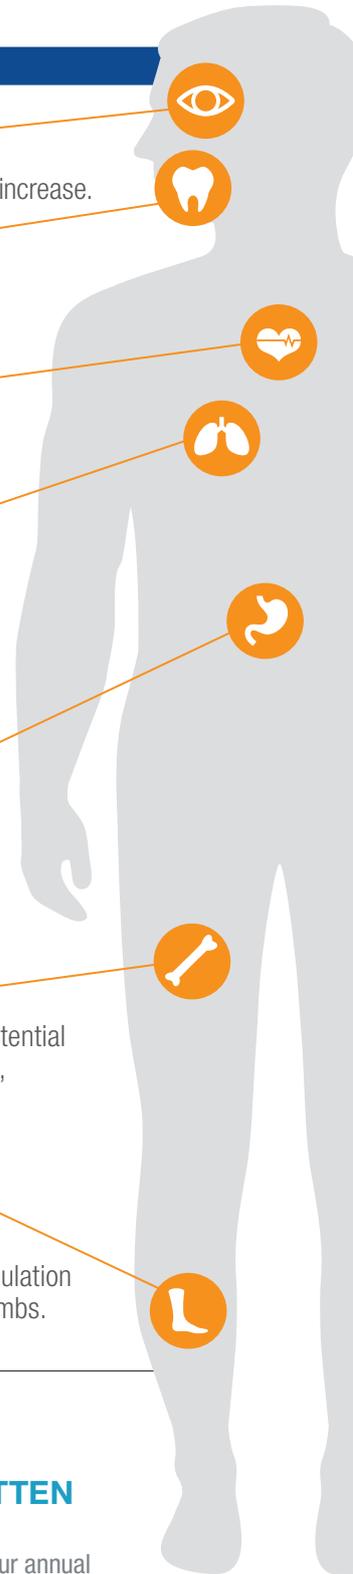

Smoking can lead to cancer in almost any organ, including the stomach, bladder and colon.

#### BONES

Weaker bones are a potential side effect for smokers, especially women.

#### FEET/LEGS

Reduced blood flow from smoking contributes to poor circulation in the skin and lower limbs.

## Flu Nonfiction

Influenza season is here, just like every year, and yet misconceptions still exist. Here are three flu stories that need to stop.

**STORY #1: Flu germs spread by shaking hands, not by sharing books.** Spoiler alert! Those nasty bugs can live on hard surfaces (books, doorknobs, computers, kitchen counters) anywhere from two to eight hours. Grab a disinfectant wipe, stat!

**STORY #2: I don't have a fever, so I don't have the flu.** Wrong. Symptoms vary, and not everyone who has the flu gets a fever. You could have one or all of these signs: chills, cough, sore throat, body aches, congestion, diarrhea and vomiting.

**STORY #3: It's too late to get a flu vaccine.** No, it's not. Flu season peaks in January and February and can last until May. Now's the time to make your appointment.

### STILL HAVEN'T GOTTEN YOUR VACCINE?

Don't wait any longer to get your annual flu vaccine. Visit [FindDrRight.com](http://FindDrRight.com) to find a physician near you.

## Safety First

Learn about the Level 1 trauma center at Baylor Dallas and find out how to prevent an emergency in the first place. Visit [BaylorHealth.com/DallasER](http://BaylorHealth.com/DallasER) today.

## Answers

**1. False.** “We wish all people would carry the names and phone numbers of their doctor and an emergency contact, because we look for them,” says Elizabeth Fagan, MD, emergency department medical director at Baylor Medical Center at McKinney. “Having that information is really important, especially when a patient is unable to speak for themselves.”

**2. False.** Although chest pain should always be taken seriously, emergency care may not be necessary if it is caused by movement (could be musculoskeletal in nature) or present when breathing deeply (possibly tied to a lung condition). Seek emergency medical attention if chest pain is new or different, or it feels like pressure, tightness or fullness and lasts longer than a few seconds or goes away and comes back, especially with exertion. Other reasons to seek immediate care include shortness of breath, sweating, and discomfort in the neck, shoulders, upper back, jaw or either arm. Women might experience different heart attack symptoms, including fatigue, abdominal pain, nausea or lightheadedness.

**3. d.** Having your medical history available in an emergency helps medical staff know how to best treat you. But if nothing else, write down and keep with you a list of pertinent allergies. “If we don’t know what you’re allergic to, we worry when ordering medication, because we don’t want to make things worse,” Dr. Fagan says. “We need to know about allergies to anything you might encounter in the emergency department—medications, antiseptics or latex.”

**4. b.** CPR compressions should be hard and fast—faster than most people think. If you ever find yourself in a situation where you have to give CPR, just keep in mind the tempo of “Stayin’ Alive.”

# Emergency IQ

## Test your knowledge about urgent medical situations

**➔** For most of us, emergencies are (thankfully!) few and far between. But that makes them difficult to prepare for. Find out how well-versed you are in handling the unexpected.

**1 True or false:** Emergency department staff don’t have time to look for “in case of emergency” information before treating a patient.

**2 True or false:** Chest pain is always an emergency.

**3** Which types of allergies are important for medical staff to know about?

- a. Seasonal
- b. Medication
- c. Soap/antiseptic
- d. B and C
- e. All of the above

**4** CPR compressions should be hard and fast and to the beat of which iconic disco tune?

- a. “YMCA”
- b. “Stayin’ Alive”
- c. “FUNKYTOWN”
- d. “Turn the Beat Around”

# In the Clear

## Understanding the lesser-known causes of lung cancer

Even if you've never touched a cigarette in your life, it's important to know there are things besides smoking that increase your chances of getting lung cancer.

"Smoking is definitely the number-one risk factor for lung cancer and plays a role in about 90 percent of lung cancers," says David Mason, MD, chief of thoracic surgery and lung transplantation at Baylor University Medical Center at Dallas and medical director of the Chest Cancer Research and Treatment Center at Baylor Charles A. Sammons Cancer Center at Dallas. "But there are also other important risk factors patients should be aware of."

### SECONDHAND SMOKE

A large contributor to lung cancer is being around people who are in the habit of smoking. "Secondhand smoke is almost as damaging to the lungs as firsthand smoke," Dr. Mason says. "It depends on proximity and duration of exposure."

Each year, more than 7,300 lung cancer deaths among nonsmokers in the U.S. are attributed to secondhand smoke, according to the Centers for Disease Control and Prevention. And research suggests that people who are regularly exposed to secondhand smoke at home or at work have a 20 to 30 percent greater chance of having lung cancer than others.

### RADON

Exposure to radon presents another, lesser risk of lung cancer but one that deserves attention. According to the American Cancer Society, about 11 percent of the 221,000 lung cancer cases expected to be diagnosed in the U.S. in 2015 will be from radon exposure. Radon is an odorless natural gas that's released from rocks and soil in certain areas and can get trapped in homes and other buildings. The Environmental Protection Agency estimates that one in 15 homes has high radon levels. Call the Texas Department of State Health Services at 800-293-0753 to inquire about radon testing.

### OTHER CAUSES

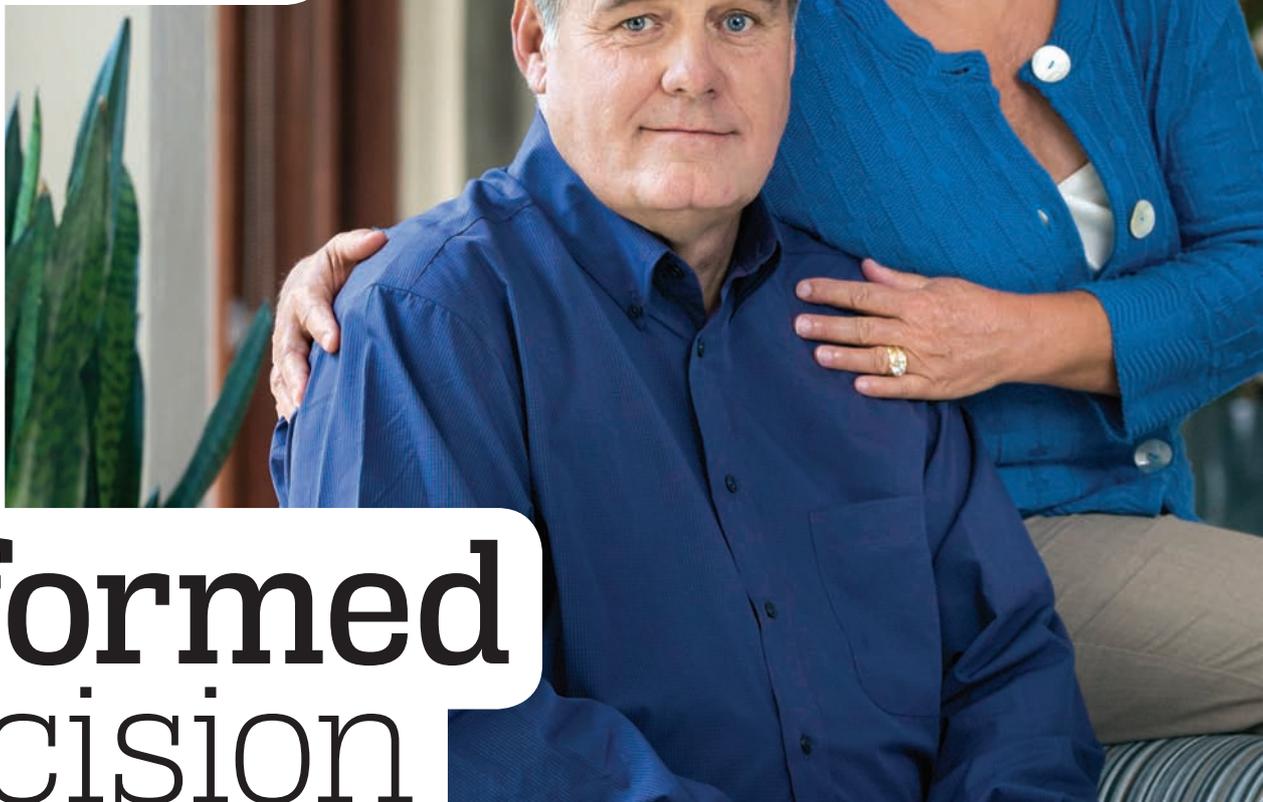

If you are concerned that you've been exposed to asbestos, arsenic or diesel exhaust; have a family or personal history of lung cancer; or previous radiation to the chest, you might want to see a care provider.

"Lung cancer isn't the most prevalent of cancers, but it is one of the most deadly," Dr. Mason says, noting that when it shows symptoms many times it has spread to other parts of the body. "Talk to your doctor about your risk factors and to determine if lung cancer screening is right for you."

### LEARN ABOUT YOUR LUNGS

Go to [BaylorHealth.com/DallasLungCancer](https://www.baylorhealth.com/DallasLungCancer) for details on lung cancer types and treatment, plus support for patients and families dealing with the disease.

“The doctor gave me the peace of mind that everything was going to be OK.” —Ray Jackson

# Informed Decision

**A prostate cancer diagnosis doesn't have to be devastating, but it does mean educating yourself about treatment options**

➔ Ray Jackson admits that when his urologist told him, “You have prostate cancer,” he didn't hear anything else after that. So the 58-year-old from Greenville, Texas, appreciated being asked to come back in a couple of days to discuss his options.

After learning about the benefits and risks of each treatment, Jackson decided on minimally invasive robotic surgery to remove his prostate. The shorter recovery time, compared with traditional surgery, was appealing. Within a month of his surgery at Baylor University Medical Center at Dallas in late 2012, Jackson was fully recovered

from the procedure—and has remained cancer-free ever since.

“Being diagnosed with prostate cancer isn't the end of the world,” says W. Scott Webster, MD, chief of urology at Baylor Dallas. “You just need to partner with your doctor to come up with a plan that's suited to you. There's not a one-size-fits-all approach.”

The idea of there being a single treatment that's right for everyone is one of the misconceptions people have about prostate cancer diagnosis and treatment.

Here are a few facts to keep in mind.

### **MEN USUALLY DON'T NEED A PSA TEST EVERY YEAR.**

Screening for prostate cancer begins with a prostate-specific antigen (PSA) blood test and a rectal exam.

"PSA testing is a good tool for screening at-risk populations," Dr. Webster says. "I think select patients who have at least a 10-year life expectancy or a family history of prostate cancer should be screened between the ages of 50 and 65."

Dr. Webster suggests that men get a baseline PSA test around age 50 but says they don't necessarily need a test every year unless they have symptoms such as difficulty urinating, blood in the urine or pain during urination.

Jackson previously had a PSA test, so his doctor noted a change in his PSA

level and ordered a prostate biopsy to confirm the cancer diagnosis.

### **NOT EVERY CASE OF PROSTATE CANCER REQUIRES IMMEDIATE TREATMENT.**

Some prostate cancer is considered low-risk and would spread so slowly that it might never shorten life expectancy. That means doctors don't necessarily need to be aggressive in treating those cancers, and instead they can take a "watchful waiting" or observational approach.

"I tell a lot of men that we don't necessarily have to be really aggressive in treating low-risk prostate cancer," Dr. Webster says. "We just need to keep an eye on it to make sure it doesn't become a high-risk problem."

### **INCONTINENCE AND IMPOTENCE ARE NOT INEVITABLE AFTER PROSTATE CANCER TREATMENT.**

Jackson is proof that these side effects don't happen to everyone. Once his post-surgical catheter was removed, he only needed to wear protective briefs for a few days until he was confident he could control his bladder.

He credits exercises explained to him by the team at Baylor Dallas with regaining function so soon after surgery. "They taught me how to strengthen my pelvic floor muscles, which they said would be weakened by surgery," Jackson says. "They said I'd recover more quickly if I learned how to control them ahead of time, and they were right."

Jackson also started having erections again within about 90 days of surgery. "Everything works great," he says, "just like it did before."

### **MEN SHOULD CHOOSE THE TREATMENT THAT'S RIGHT FOR THEM.**

Although there are some experimental treatments for prostate cancer, Dr. Webster doesn't recommend them. He thinks the five mainstream treatments—observation, surgery, radiation, freezing the prostate with cryotherapy or using hormonal manipulation—give men all the options they need.

"Men should decide if they're comfortable leaving the prostate alone and, if they choose treatment, which potential side effects they're most comfortable with," Dr. Webster says. "Which treatment to choose is an individual decision a man should make in conjunction with his doctor."

## **CANCER EXPERTS IN YOUR CORNER**

The Genitourinary Cancer Research and Treatment (GCRT) Center takes a team approach to treat prostate cancer.

"In one place, we've assembled expertise from across multiple medical disciplines—urology, oncology and radiation," explains Thomas Hutson, DO, PharmD, medical director of the GCRT Center at Baylor University Medical Center at Dallas.

Personalized treatments are developed at focused gatherings of the center's cancer experts. "We come up with a treatment plan that's specific for the individual patient and the characteristics of their tumor," Dr. Hutson says.

Specialists at the GCRT Center do more than stay informed about innovations. They actively expand the frontier of what's possible.

"We participate in large-scale research studies along with other leading cancer centers around the country," Dr. Hutson says. "Our patients don't have to travel to get access to advanced treatment options."

**Avoid these 5 holiday hazards for a more joyful season**

# Tidings of Health

➔ It seems as though the holidays are less “peace on earth” and more “stretched to the ends of the earth,” which makes it easy for good habits to fall by the wayside. Use this guide to help you navigate the season, healthfully.

## **1 HOLIDAY HEALTH HAZARD: WEIGHT GAIN**

First, the good news: American adults, on average, gain only about a pound during the fall and winter months. The problem is, few of us ever lose it, meaning those pounds add up over time. And adults who are already overweight typically gain more.

“The holidays tend to be challenging for people who are trying to control their weight because there are more opportunities to eat and overeat,” says Jennifer Flory, MD, a family medicine physician at Scott & White Clinic – Westfield.

Dr. Flory suggests planning family get-togethers around activities rather than food. “Push away from the dinner table,” she says. “Go for a walk, go to the park or take the kids ice skating.”

## **2 HOLIDAY HEALTH HAZARD: THE BUFFET TABLE**

No matter how much you avoid food-focused activities, you’ll likely find yourself in the presence of at least one buffet spread. The first thing you should do is ask the host if you can contribute a dish—that way you’ll know there will be at least one healthy option.

Another tip is to eat before you go, so you’re not as tempted to overindulge at the event, Dr. Flory says. But if you are the type of person who would eat before and then eat again

there, this might not be the best solution for you. Instead, try drinking a tall glass of water to fill you up and using a small plate to limit portions.

For those with chronic conditions such as diabetes, don’t let all the festive fare derail your treatment plan. “If you have a health issue, it’s important to follow the diet your doctor has you on throughout the holidays,” Dr. Flory says. “And continue to take your medications as prescribed, too.”

At gatherings, keep portions small.

## SPREAD HOLIDAY JOY IN OUR COMMUNITY AND BEYOND

Choosing to be generous with your time and money around the holidays “breaks you away from concern about yourself,” says Donald E. Sewell, PhD, director of Faith in Action Initiatives (FIAI) for Baylor Scott & White Health. “Focusing on the needs of others puts life in perspective.”

FIAI puts compassion in action by donating gently used medical supplies and equipment and supporting health care providers in volunteering and medical missions, serving both local free access clinics and international locations. “We are taking the resources of the Baylor Scott & White system

outside our walls,” Dr. Sewell says. During the Ebola outbreak, for example, FIAI sent a cargo container full of medical supplies to Liberia.

Community members can support FIAI in a variety of ways. Visit [BaylorHealth.com/FaithInAction](http://BaylorHealth.com/FaithInAction) for information about volunteering or making a donation.

### ► Did You Know?

Since 2009, FIAI has supported more than 100 free access clinics in North Texas, as well as clinics and hospitals in more than 25 countries.

**MORE**

## Help Others Have a Happy Thanksgiving

Join Faith in Action Initiatives in making turkey sandwiches and packing pre-Thanksgiving meals to distribute to people who are homeless. Email the FIAI volunteer coordinator at [sofia.alluri@BaylorHealth.edu](mailto:sofia.alluri@BaylorHealth.edu) for more information.

### 3 HOLIDAY HEALTH HAZARD: SEASONAL DEPRESSION

If this time of year has you feeling blue, don't ignore it.

“Holiday depression is still depression. People need to see their doctor for it,” Dr. Flory advises. “Beyond that, try to get out and do things with family and friends so you're not isolated at home.”

### 4 HOLIDAY HEALTH HAZARD: TOO MUCH BUBBLY

With a party around every corner, be sure to watch it with the drinks. Even a few weeks of too many toasts can have negative effects on the heart. Alcohol raises blood pressure and the risk for heart failure, according to the American Heart Association. Women should average no more than one drink per day, and men one to two.

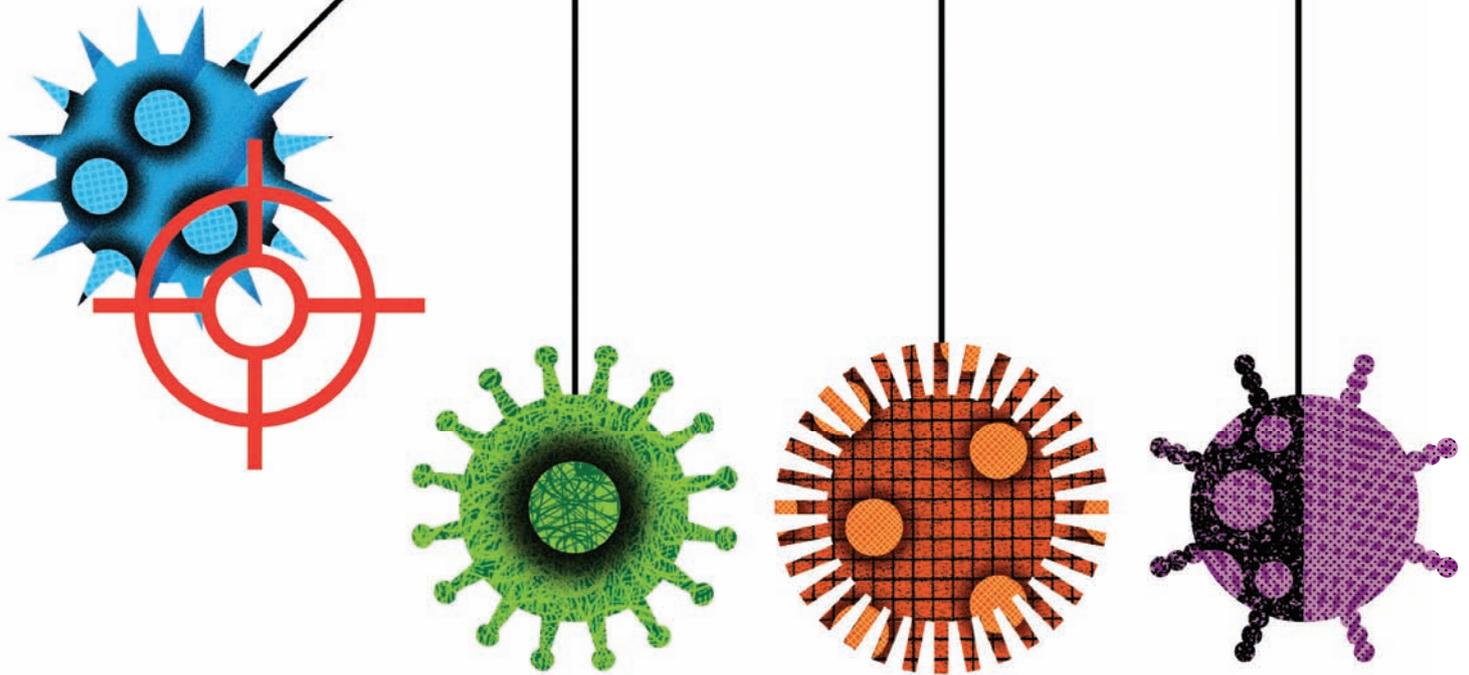

Another reason to cut back on the bubbly? “There's a large source of calories in alcoholic beverages,” Dr. Flory says. “Have only one cocktail. Otherwise, stick to water or spritzers that don't have any calories.”

### 5 HOLIDAY HEALTH HAZARD: EXCESS STRESS

You know it's coming—party planning, home decorating, gift shopping and other holiday obligations to be squeezed into an already busy lineup. The first step to managing stress is to schedule everything, even your own to-do list, so these extra tasks don't become burdensome at the end of a long day.

Then, practice saying no. You don't owe anyone a reason for not being able to attend another gathering or bake another batch of cookies. But if your schedule is full with the activities you've added, you can confidently say, “Sorry, I already have a commitment that day.”

# Moving Target

Monitoring the effectiveness of this year's seasonal flu vaccine is critical to developing the next one

➔ The seasonal flu vaccine protects millions of Americans a year from influenza, a virus that can lead to hospitalization and even death. Because influenza viruses are constantly evolving, a new vaccine is designed each

year to fight the strains expected to be most common during the upcoming season. The vaccine is the result of a global effort, supported by Baylor Scott & White Health.

## HOW THE VACCINE COMES TO BE

The Food and Drug Administration's Vaccines and Related Biological Products Advisory Committee decides which strains will be included in the annual vaccine for the

U.S., relying on recommendations from influenza testing centers all over the world.

Since 2011, Baylor Scott & White Health – Central Division has been one of five U.S. sites that work with the Centers for Disease Control and Prevention to study the effectiveness of the flu vaccine and supply data to the FDA advisory committee. Six Baylor Scott & White clinics in Temple and Belton participate.

“During each flu season, our clinics enroll at least 800 patients ages 6 months and older who may have contracted the flu,” says Manjusha Gaglani, MBBS, section chief of pediatric infectious diseases and principal investigator of the study at Baylor Scott & White. “Then, we collect information about them, such as whether they were vaccinated, which strain they’ve contracted and how severe their illness becomes.”

She adds: “The data are also used by the World Health Organization to

identify new flu strains and anticipate possible pandemics.”

## WHAT THE FUTURE HOLDS

Although Baylor Scott & White's participation in the study for the current grant cycle culminates at the end of the 2015–16 flu season, Dr. Gaglani says the full impact of her team's research may be yet to come.

“It's my hope that the information we've gathered will ultimately be used to develop more effective flu vaccines,” she says. “I look forward to the day when one vaccine will protect us against a wider range of viruses, for more than just one season.”

## ABOUT THE STUDY

### U.S. Flu Vaccine Effectiveness Network

Researchers collect data for the Centers for Disease Control and Prevention on how well seasonal flu vaccines are working.
